Our snow socks	Technical Specification
 <p>FIG.2</p>	<p>There is an elastic band with the main fabric and the edge, which greatly increases the elasticity and versatility of the product, which can better fit the tire tightly, increase the adhesion on the road, grip ability and friction. Greatly increase the anti-skid performance of the product.</p>
	<p>There is no textile ligament made of taffeta at the edge, but a kind of elastic band.</p>
	<p>The knitting material is 60 strands of warp and 13 strands of weft. And it is vertical and jacquard. The weaving process maximizes friction. At the same time, it also greatly increases the overall wear resistance of the product.</p>
<p>FIG.1</p> 	<p>Cutting the cloth at 90 degree.</p>
 	<p>There is a piece of cloth added and sewed with 12 threads at the end, and the advantage of this is that after the product is installed on the tire, no matter how it is installed during the driving process, the force is balanced and is not limited to internal and external factors. It is always very strong and not easily broken on the ice or snowy road when driving.</p>
